Azure Cosmos DB Emulator Setup

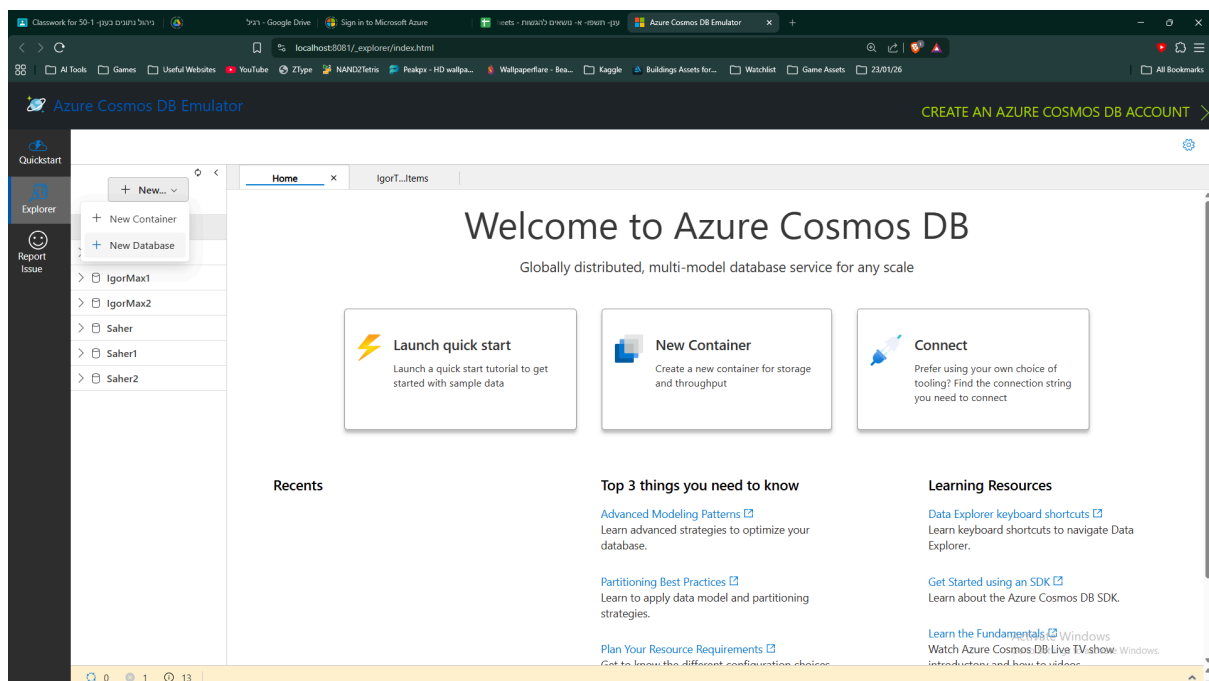

Before we install the CloudFarm Game Launcher, we need to set up the Azure Cosmos DB Emulator with the required Database and Containers.

Important Note: Make sure Azure Cosmos DB Emulator is up and running.

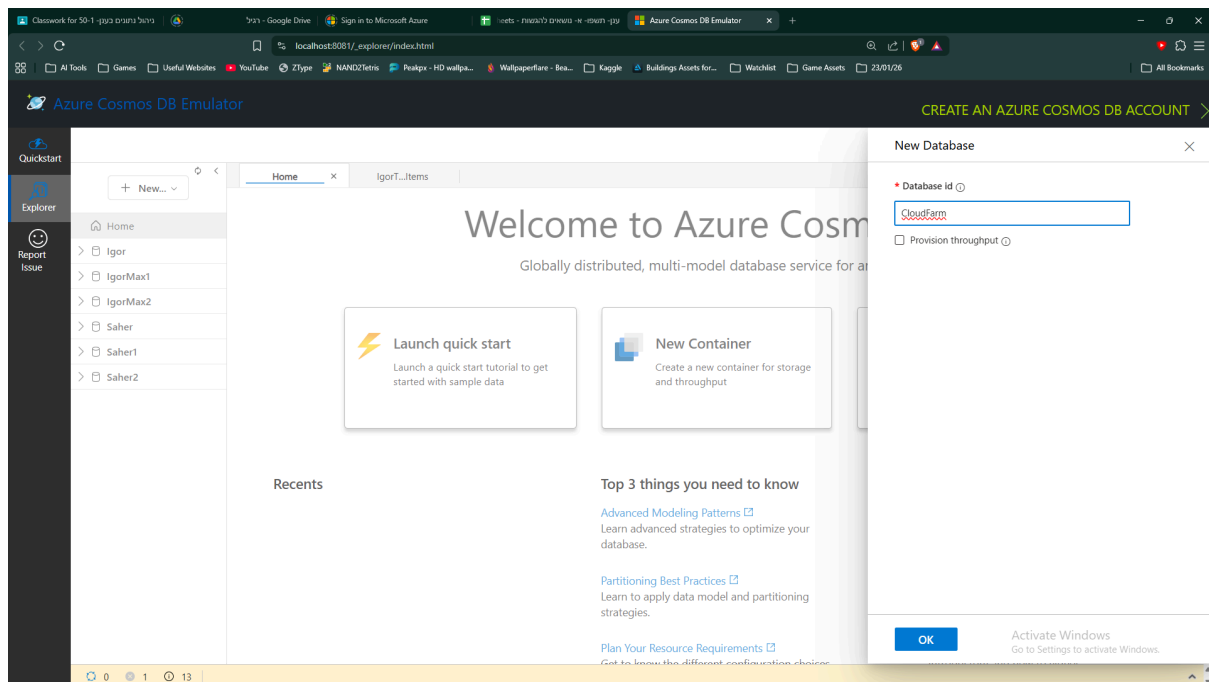

1. Setup the Database:

Click the explorer page on the left side of the screen.

Click New -> New Database

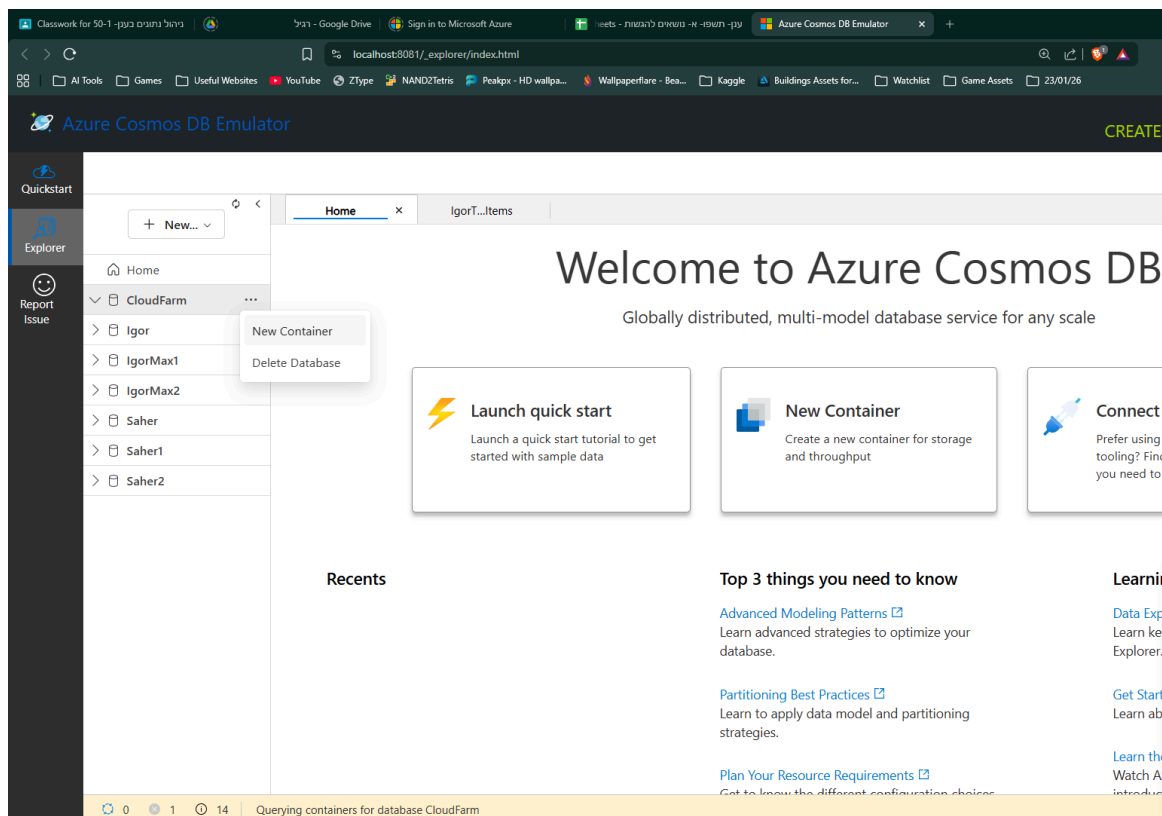

In Database id write “CloudFarm”(Capitalization is important), then click Ok.

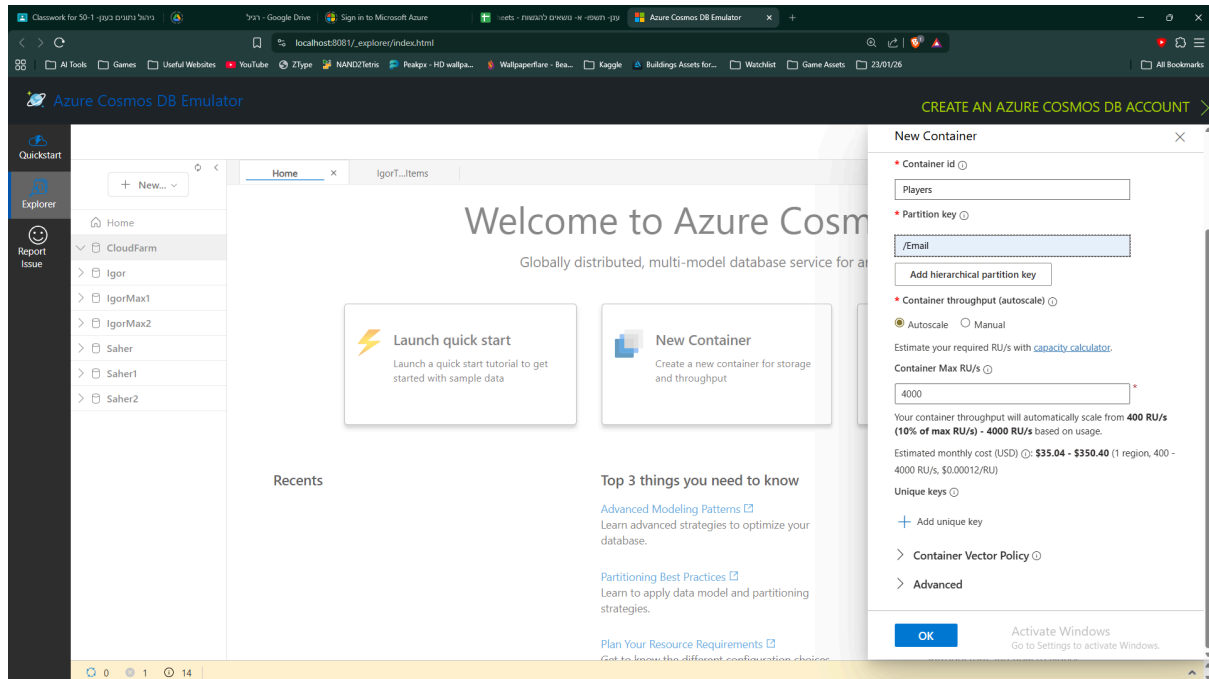

2. Setup the necessary Containers and Partition key:

Click the 3 dots on the CloudFarm Database -> New Container

On the right side we will add the required containers.
Container Names (Capitalization is important):
Players, Admins, PlayerLogs, GeneralLogs
All the containers have the same Partition key: /Email (See Image)

Note: If you encounter the following error:

New Container

Sorry, we are currently experiencing high demand in this region South Central US, and cannot fulfill your request at this time Mon, 26 Jan 2026 09:33:12 GMT. ActivityId: 7d8e00c2-4424-4d66-907a-0a14b49d6e68, Microsoft.Azure.Documents.Common/2.14.0

[More details](#)

*

Database id

Create new

Use existing

dsas

*

Container id

sadwd

*

Partition key

/id

Add hierarchical partition key

*

Container throughput (autoscale)

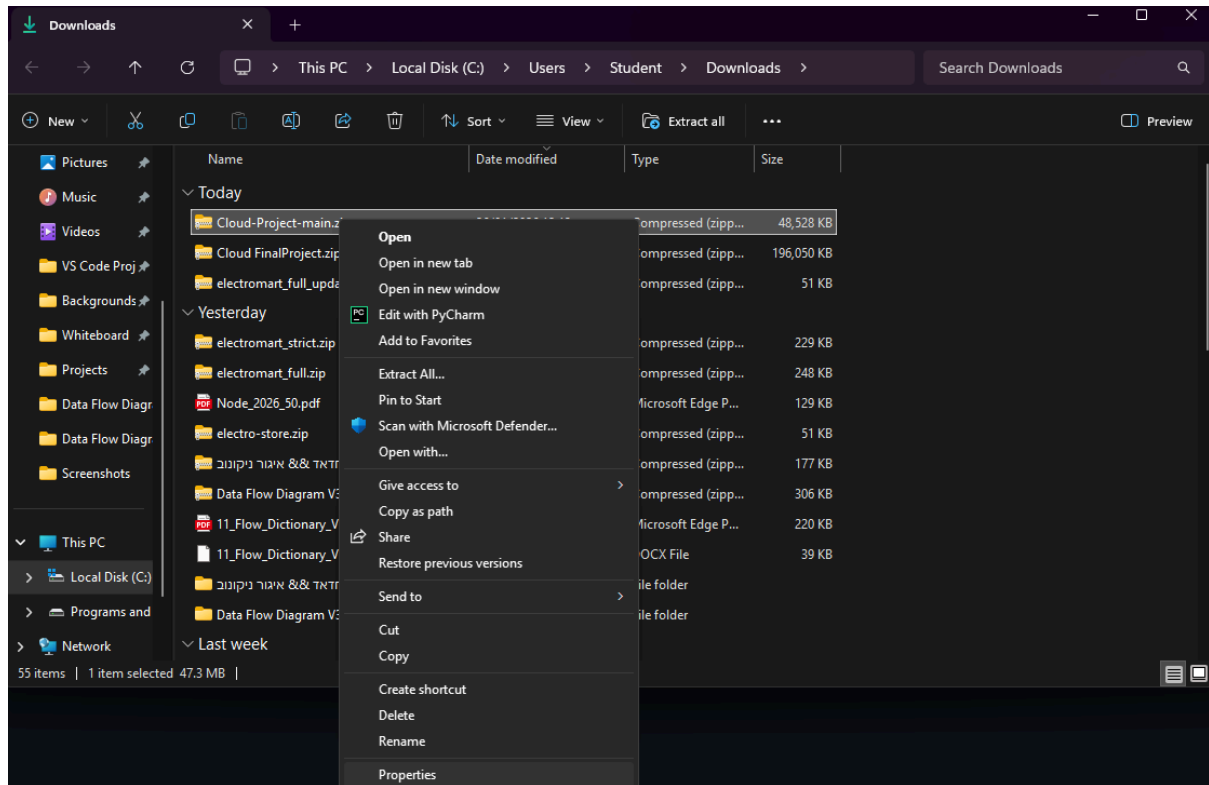

Delete any unwanted Databases and Containers, it will resolve the issue.

5

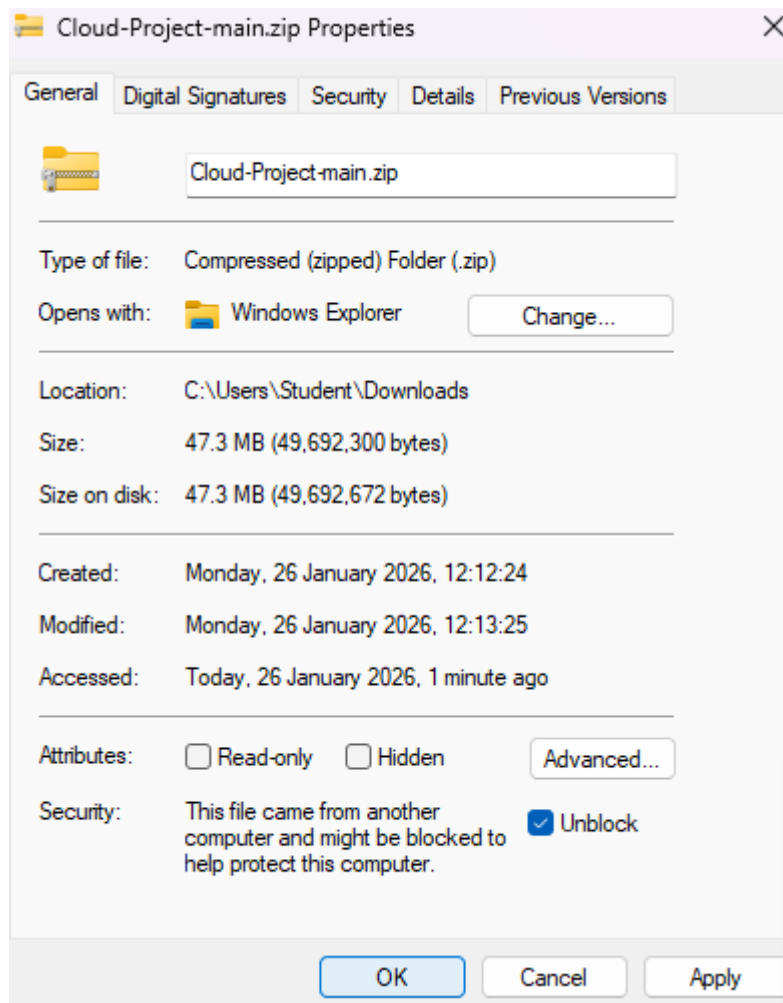

Installing the CloudFarm Game Launcher

First, Download the installation files from [GitHub](#).

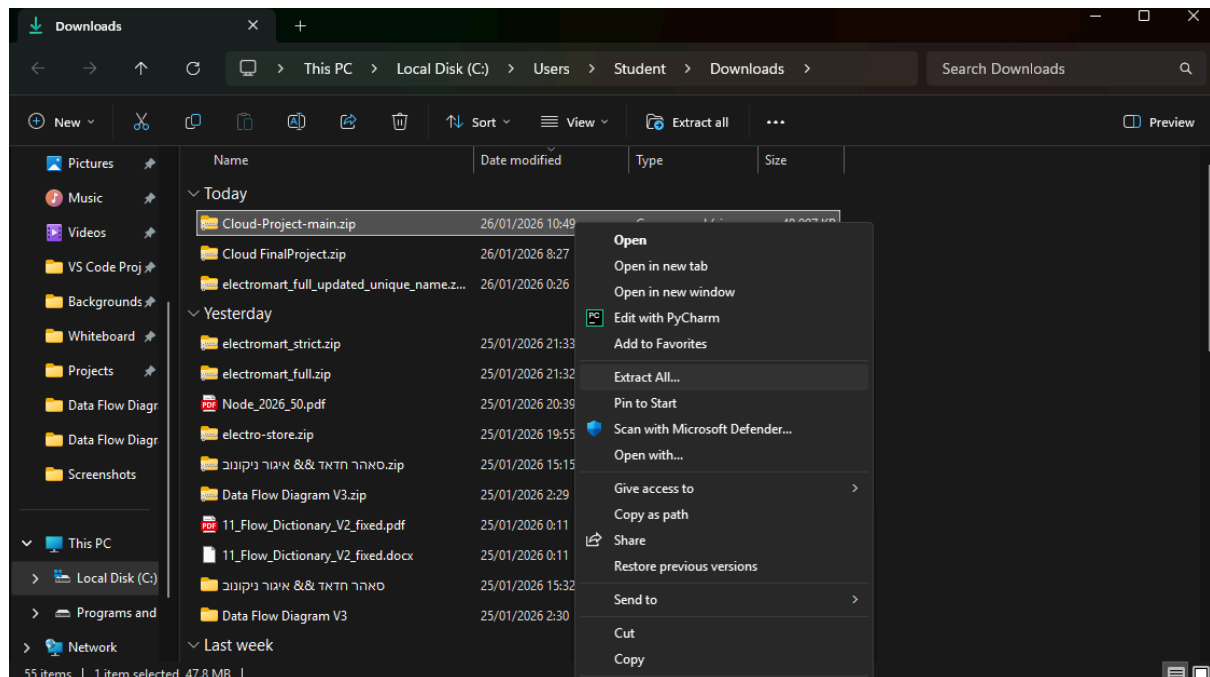

After it is done downloading, go to the folder where you saved the zip file, right click the zip file and choose “Properties”.

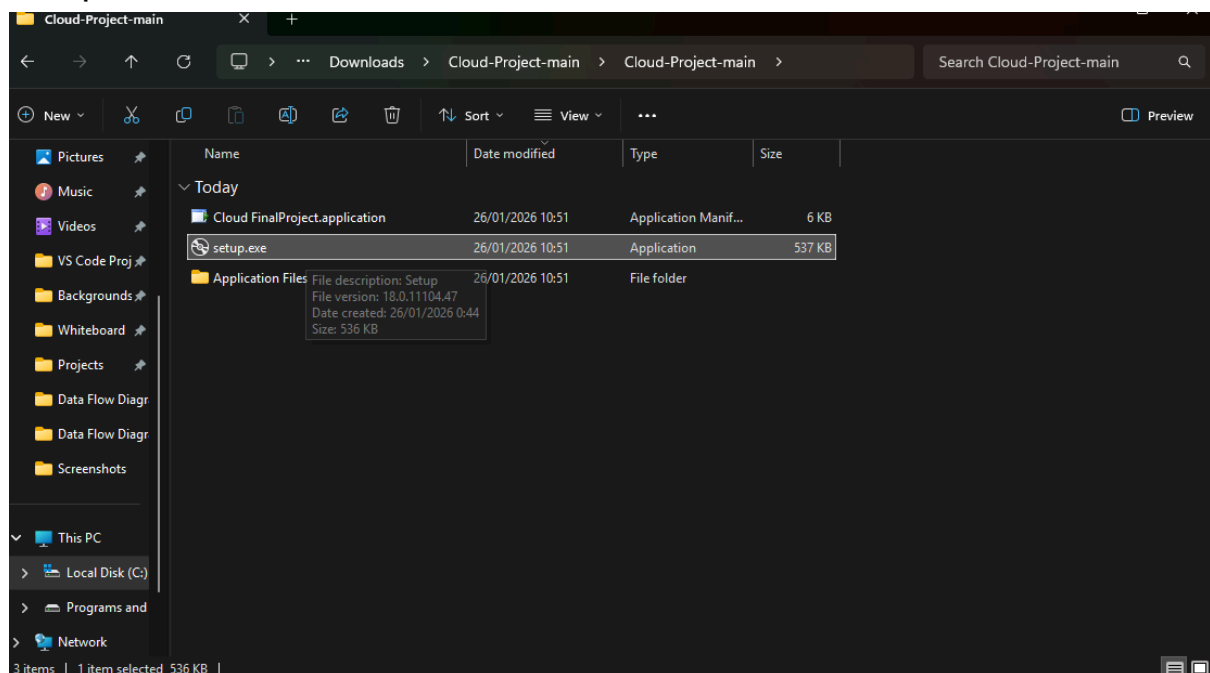

Inside Properties, make sure you tick the “Unblock” checkbox and click Ok.

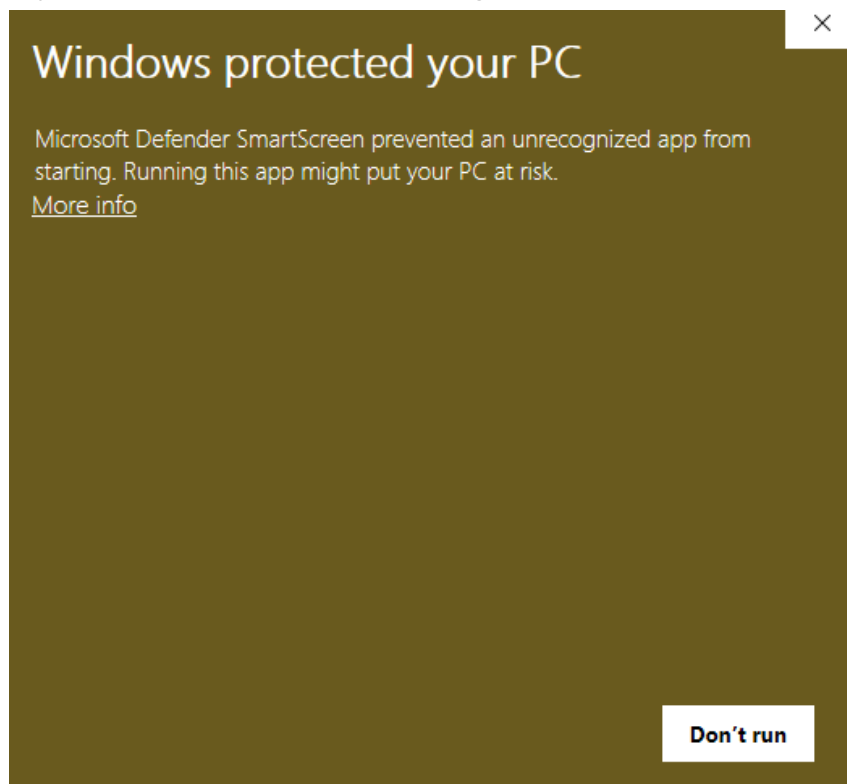

Then right click the zip file and click “Extract All...” to extract the installation files from the ZIP file.

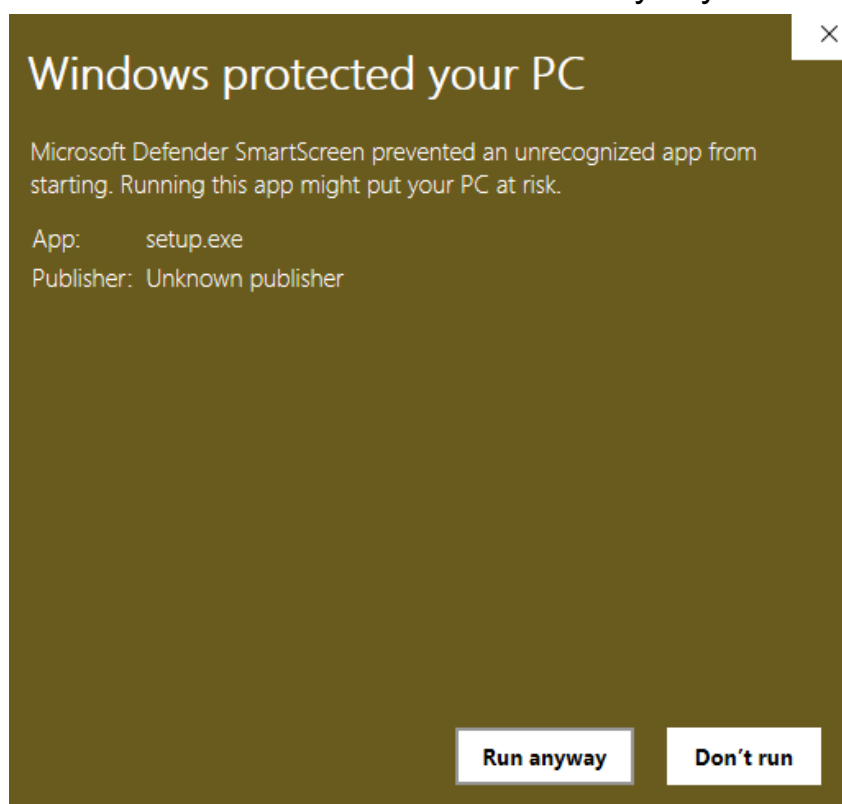

Inside the extracted folder, you'll find the Setup.exe, click it to launch the Setup Wizard.

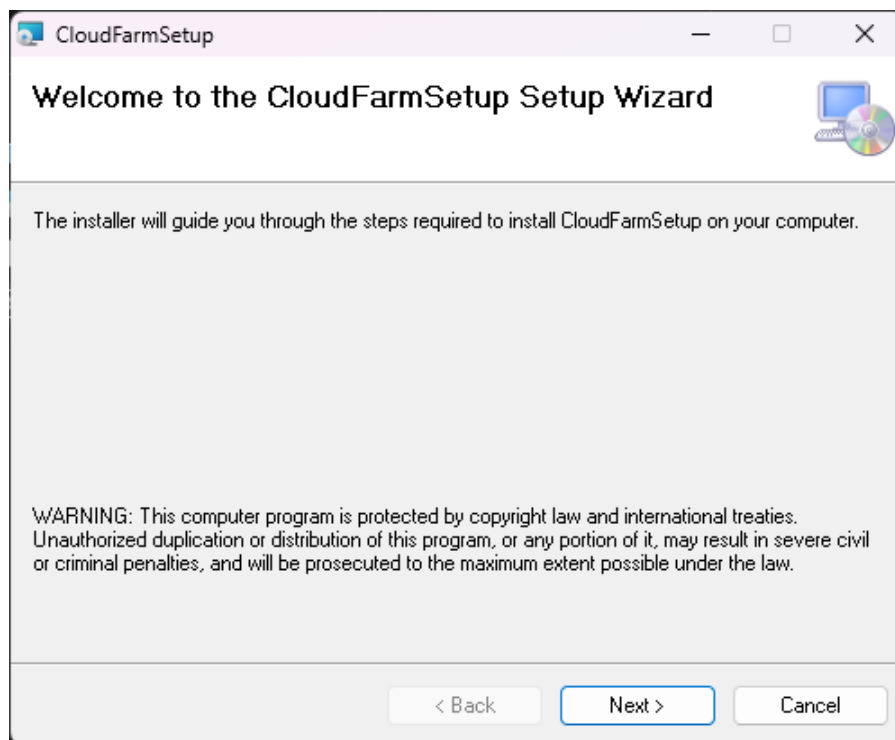

If you encounter the following window

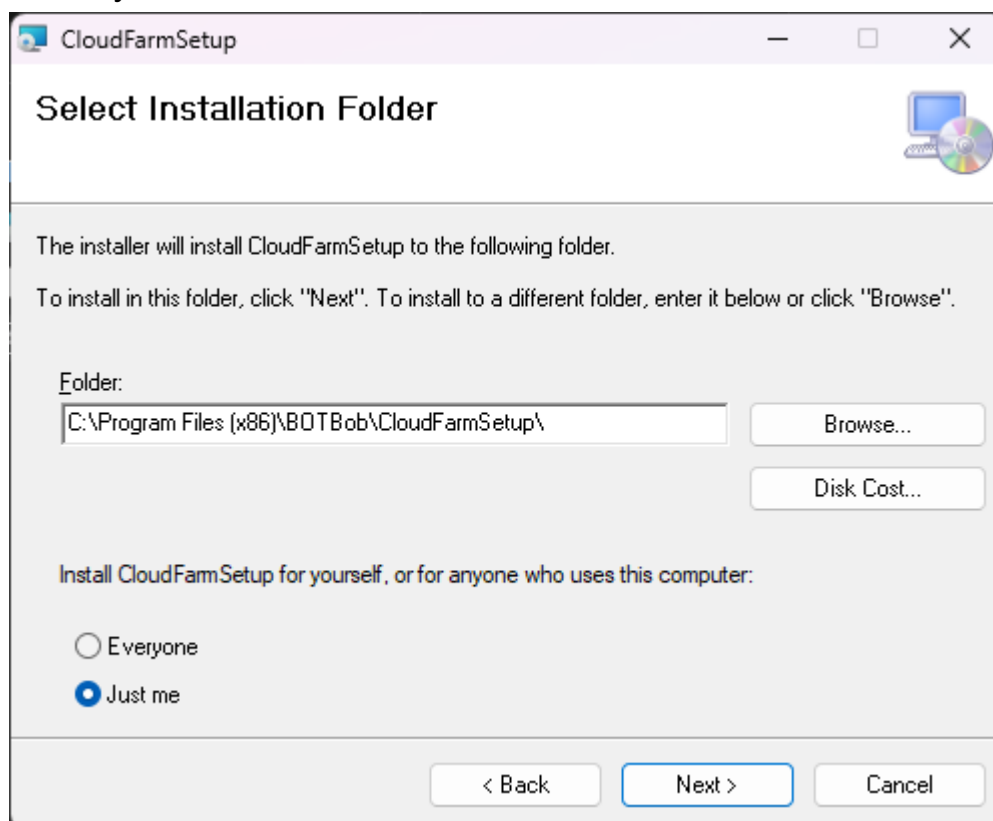

Click on "More Info" and then "Run Anyway".

Once the Setup Wizard opens, click Next

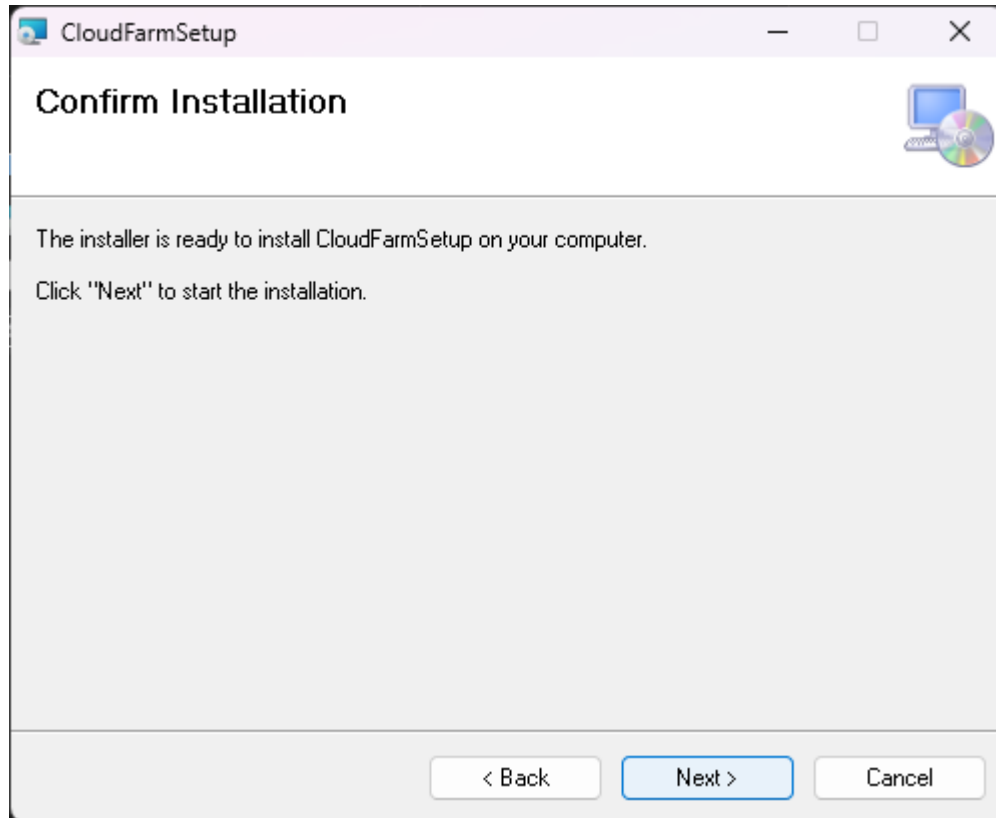

You can select where to install the Project by clicking browse.
There is an option to choose if you want to install to every user on the machine or only the current user (feel free to choose).
When you are done, click Next.

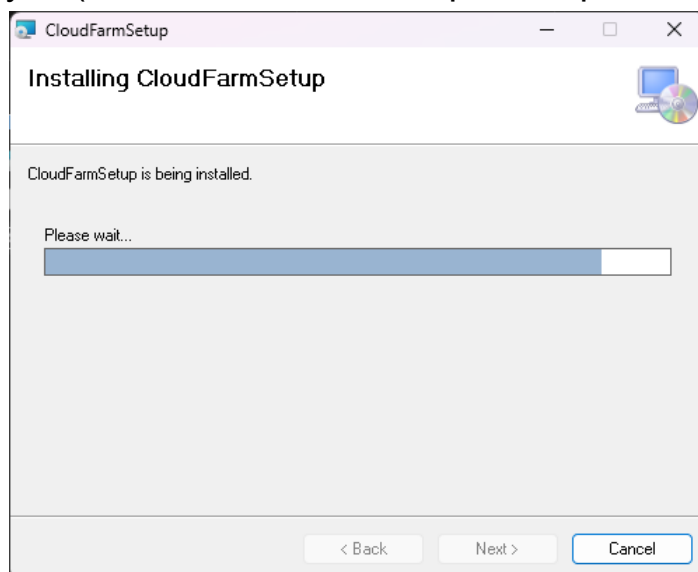

One last step before the installation begins, if you decide to change the options you set in the previous window, you have the option to click Back and do that.

When you are ready, click Next and the installation will begin.

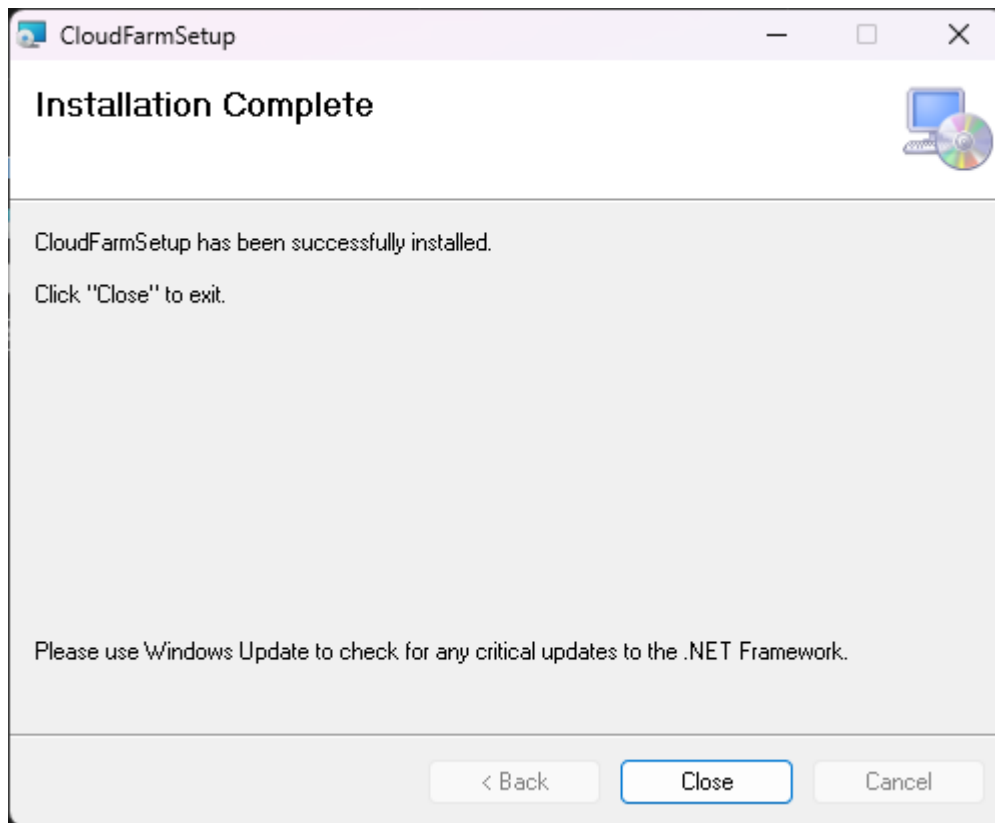

Note: you should be prompted to accept administrative access, so press yes (if the administrator requires a password, enter it).

The installation should not take long.

When the installation is done, click Close.

And that's it, the project is now installed on your machine!

CloudFarm Game Launcher features and overview

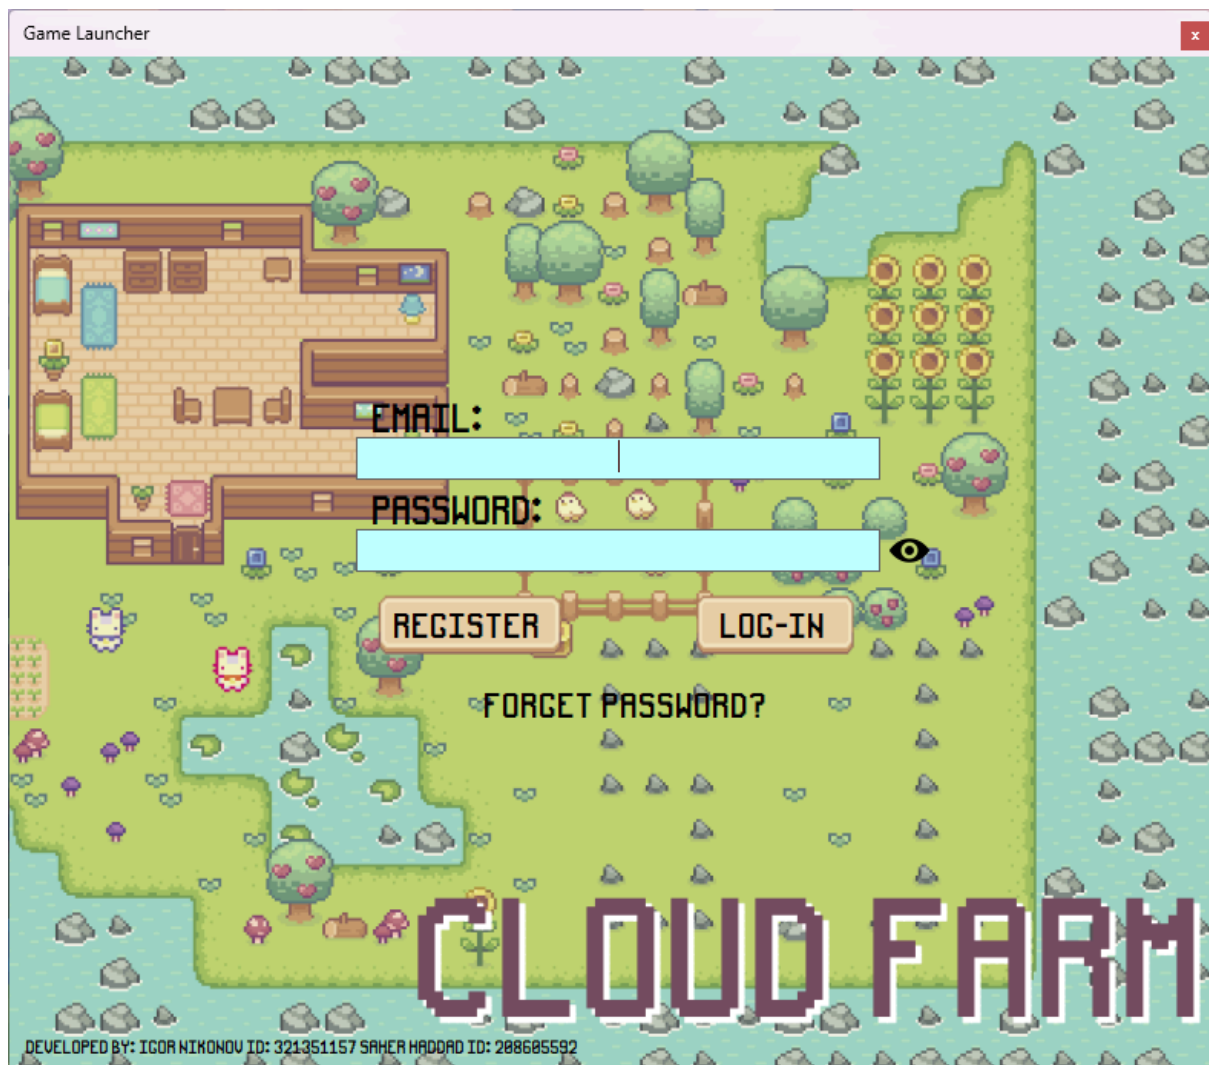

After you have successfully installed the project, you should have a shortcut on the desktop for the project application for quick launch.

1. Login, Register and Forget password

a. Login

Every time you start the application you will be presented with a login screen, here you can login to your existing player by inputting your Email and password you set when you first registered to the game.

Email and Password are checked before granting access.

b. Register

From the main login screen players can register to be able to access the game by clicking the Register button.

It will open the Register form dialog window and will require the player to input his information in order to register.

By clicking Confirm, the system will check all the fields if they are not empty and also:

If the email is written in a right format

If the password and confirm password are the same.

If all the conditions are met, the user is registered to the game and taken to the login page.

Note: Player's password is saved in the cloud with an encryption to preserve security.

The image shows a 'RegisterForm' dialog window with a pixel art background. The form contains four input fields: 'EMAIL:', 'USER NAME:', 'PASSWORD:', and 'CONFIRM PASSWORD:'. The 'PASSWORD:' field has an eye icon to its right, indicating a toggle for password visibility. At the bottom of the form are two buttons: 'CANCEL' and 'CONFIRM'.

c. Forget Password

Players who forget their password can click the forget password button in the login screen and be taken to a dialog window where they can input their email (email needs to exist) to reset their password.

They will be sent an email with a temporary randomly generated password that will be set automatically by the system.

2. Player Panel

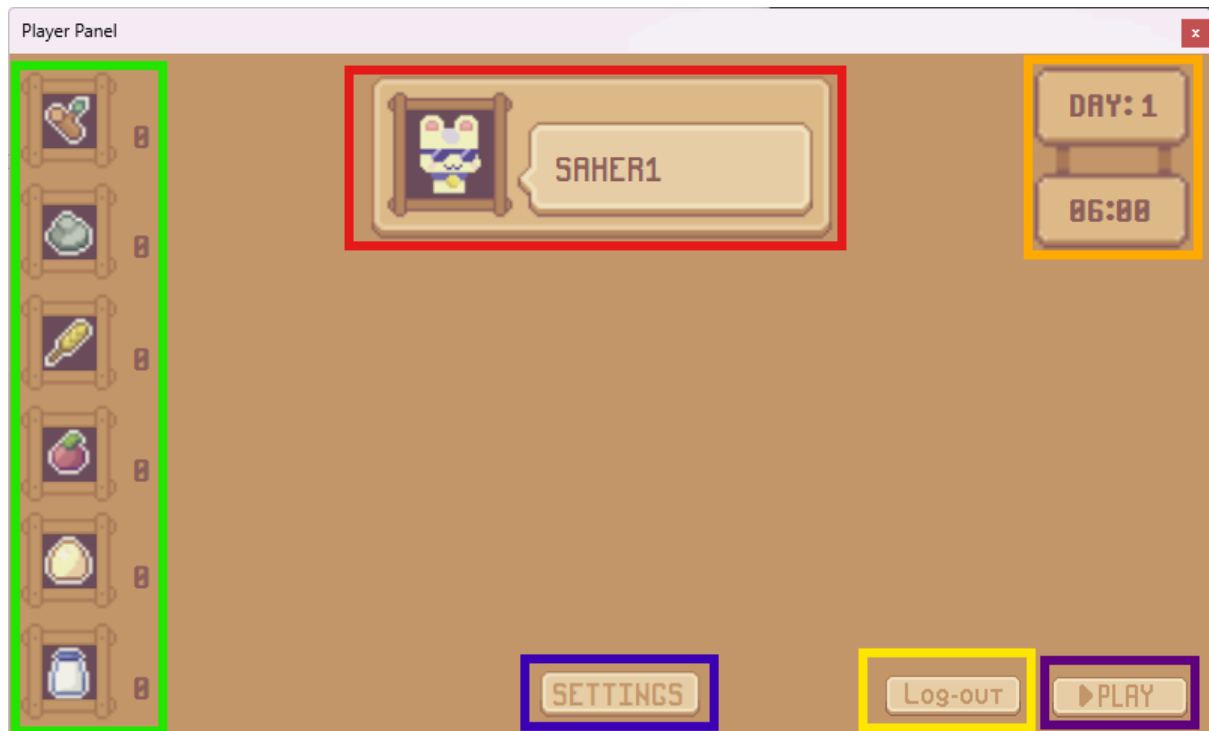

This is the main window where the player has access to his inventory, in-game time and on what day he is in the game.

The Player will have his username displayed at the top of the screen.

The Player can access his settings to perform various tweaks related to his information and save game data.

Logout button to get back to the main launcher screen.

Play button so the player can launch the game.

3. Settings Panel

In this panel, the player will have access to various options to manage his profile, like view his save file, export/import/reset his save file and change information (Email, username, password).

a. Save Details Tab

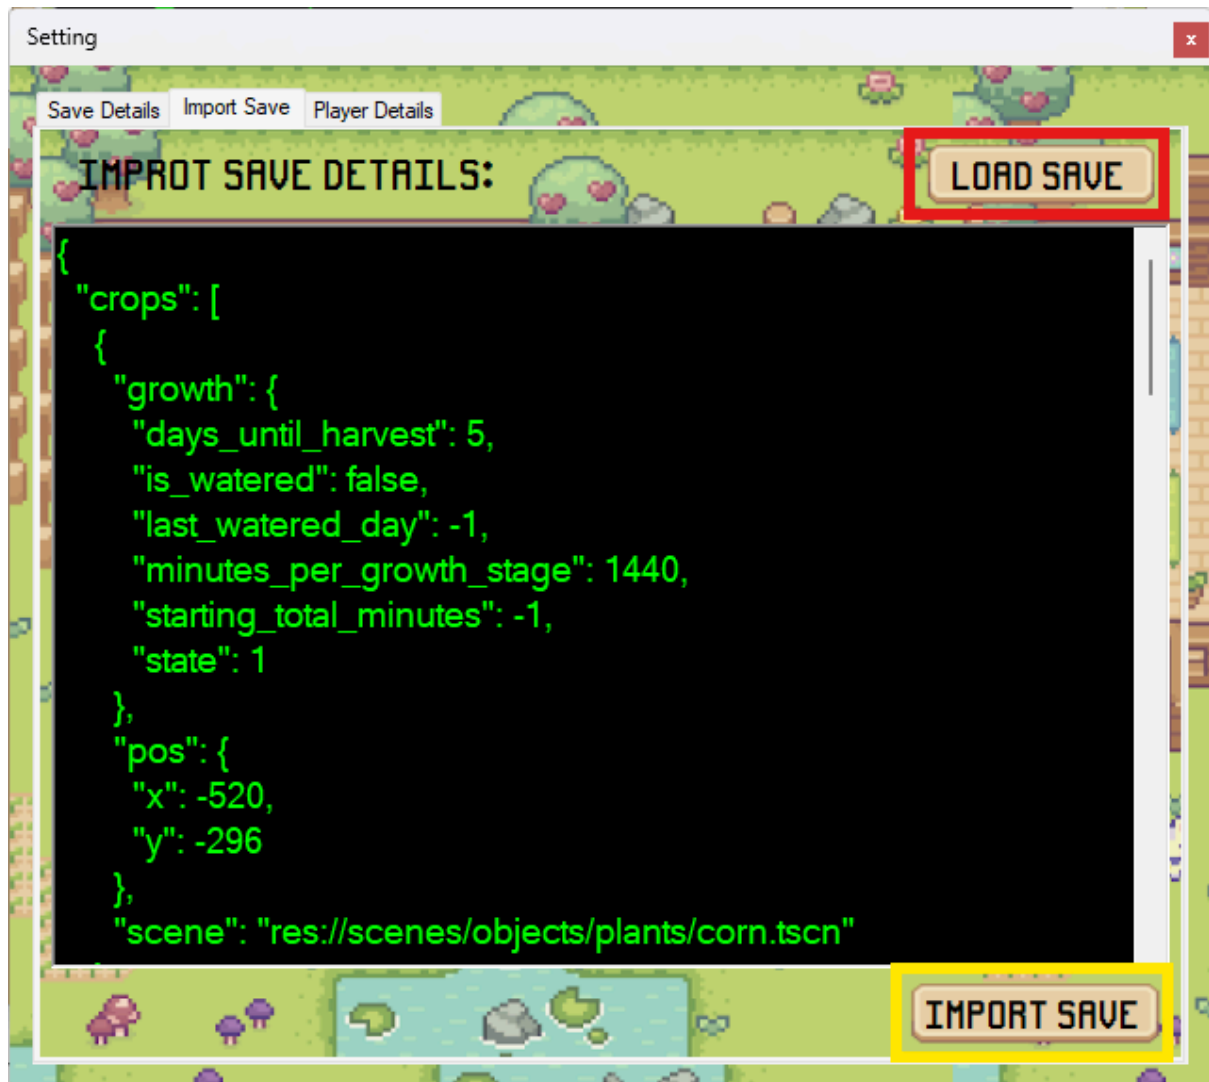

In this tab, the player can view his save game file in the rich textbox by clicking “**Show Details**”, export his current save game file to his local computer from the cloud in a json file by clicking “**Export File**”, Reset his save game file to defaults by clicking “**Rest Data**”

b. Import Save Tab

The player will be able to load his own save file (json file) to the launcher by clicking “Load Save” to view it in the rich textbox, if the file is bad the text in the rich textbox will be red and the “Import Save” button will be disabled.

If the file the player loaded shows up green in the rich textbox, that indicates that the file has passed the verification checks and ready to be uploaded to the cloud by clicking “Import Save”.

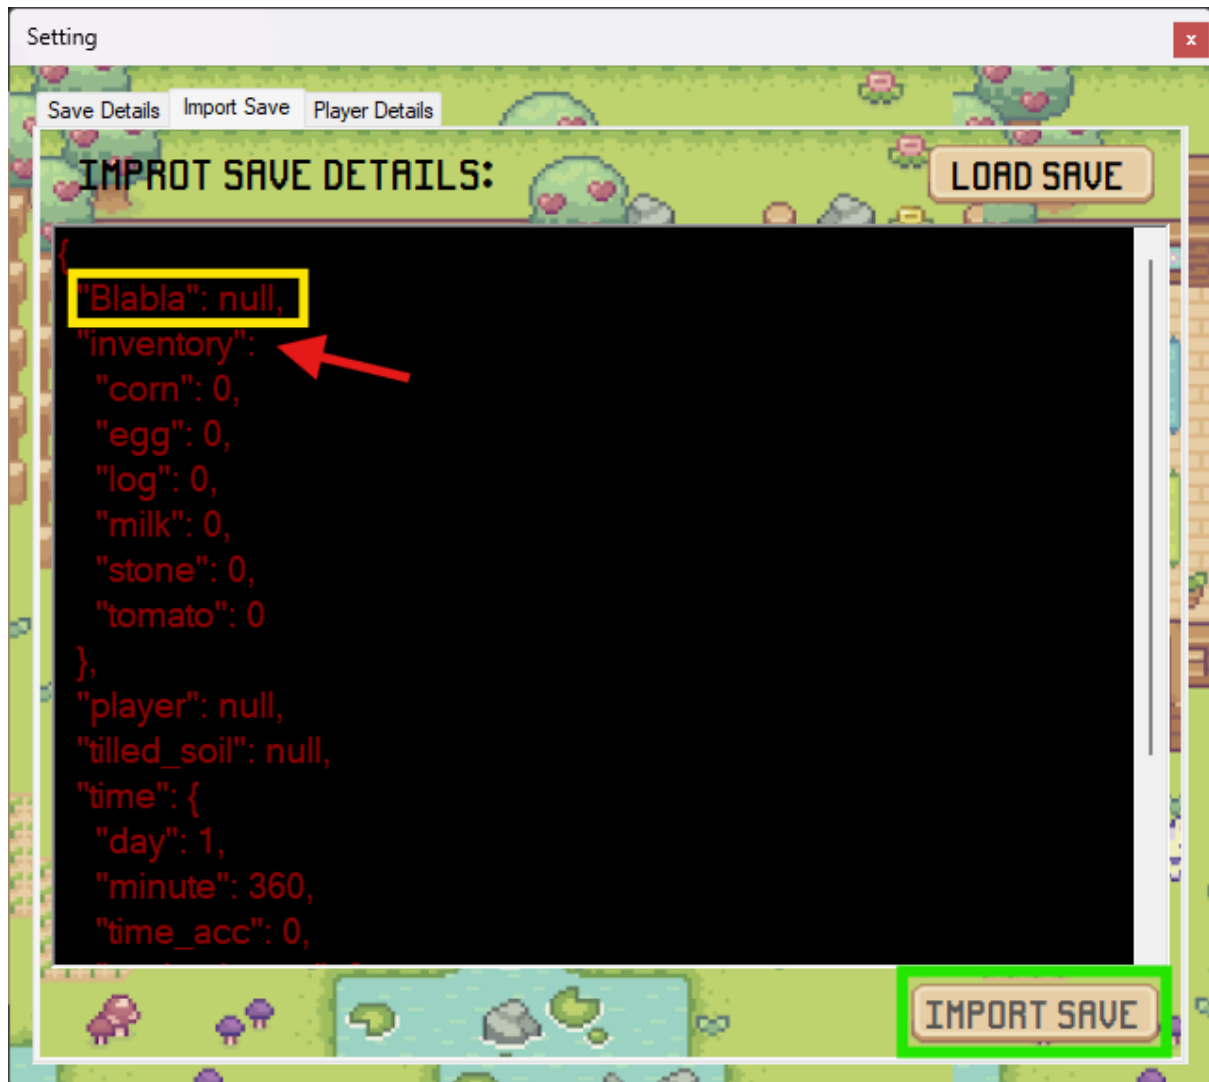

The following image is an example of a bad save file:

The content inside the json file is incorrect (it should be “crops”)

The json file structure is incorrect (open curly bracket is missing next to inventory)

Because this is a bad file, “Import Save” button is disabled

c. Player Details Tab

In this tab, the player can change his information, like Email, username and password, its optional what the player wants to change but the current password needs to be his current password in order to change one of the fields, if he want to change the password, he needs to confirm the new password, then to update his details in the cloud, he needs to click “**Save**”

The screenshot shows a 'Setting' window with three tabs: 'Save Details', 'Import Save', and 'Player Details'. The 'Player Details' tab is active, displaying a pixel-art background of a room and a river. The form contains the following fields:

- EMAIL:** A text input field.
- USER NAME:** A text input field.
- CURRENT PASSWORD:** A text input field with the placeholder text 'Current Password' and a toggle icon (an eye) to the right.
- NEW PASSWORD:** A text input field with the placeholder text 'Enter New Password'.
- CONFIRM PASSWORD:** A text input field with the placeholder text 'Confirm Password'.

A red rectangular box highlights a button labeled 'SAVE' on the right side of the form.

4. Developer/Admin Panel

The Developer and Admin Players cannot be created within the Game Launcher environment, they must be created and inserted manually through the cloud.

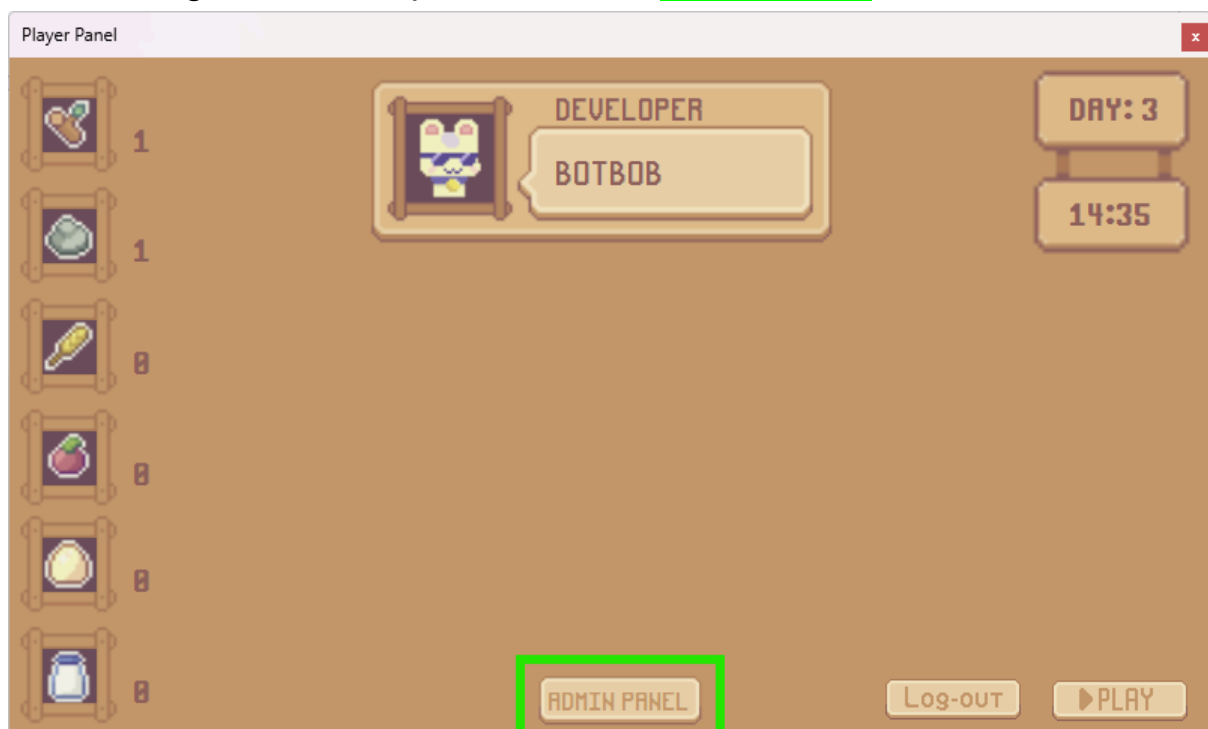

This panel is similar to the player panel but with higher level of access to the game launcher, it allows the **Admins** to view/search players that are registered to the game, display logs to manage exceptions and general game launcher activity.

The **Developer** is the only one who can manage player data and information other than the player himself, he has access to everything the launcher has to offer.

The player's level of privilege will be displayed above their username.

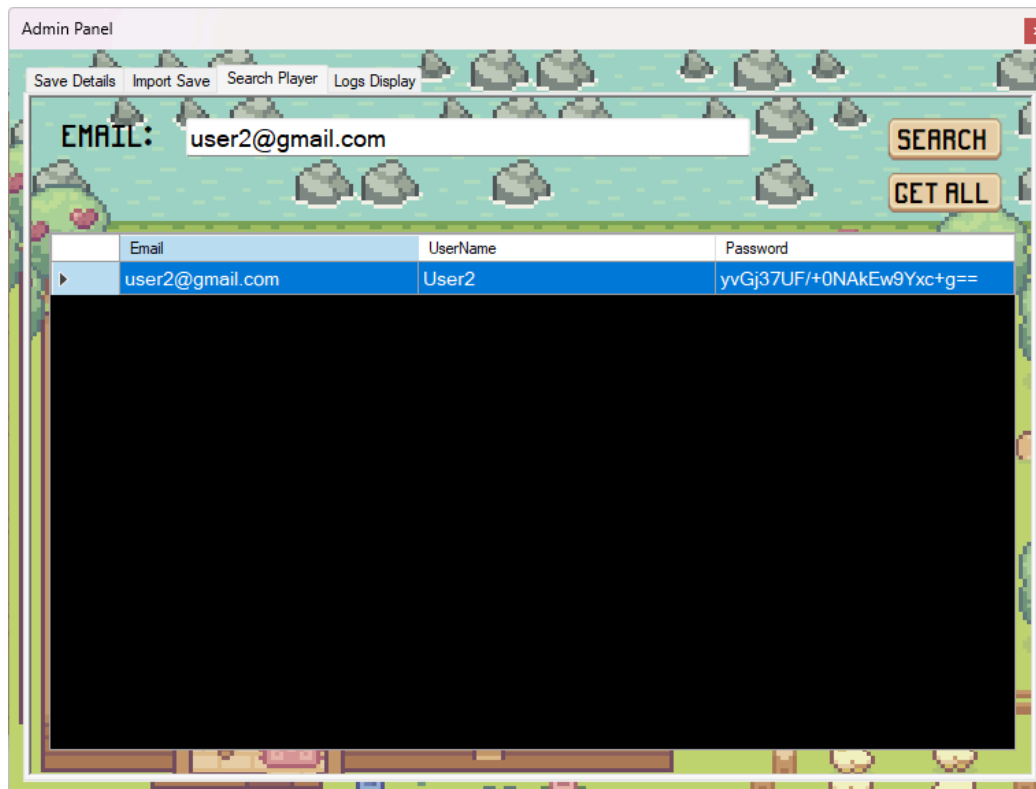

The Settings Panel is replaced with an **Admin Panel**.

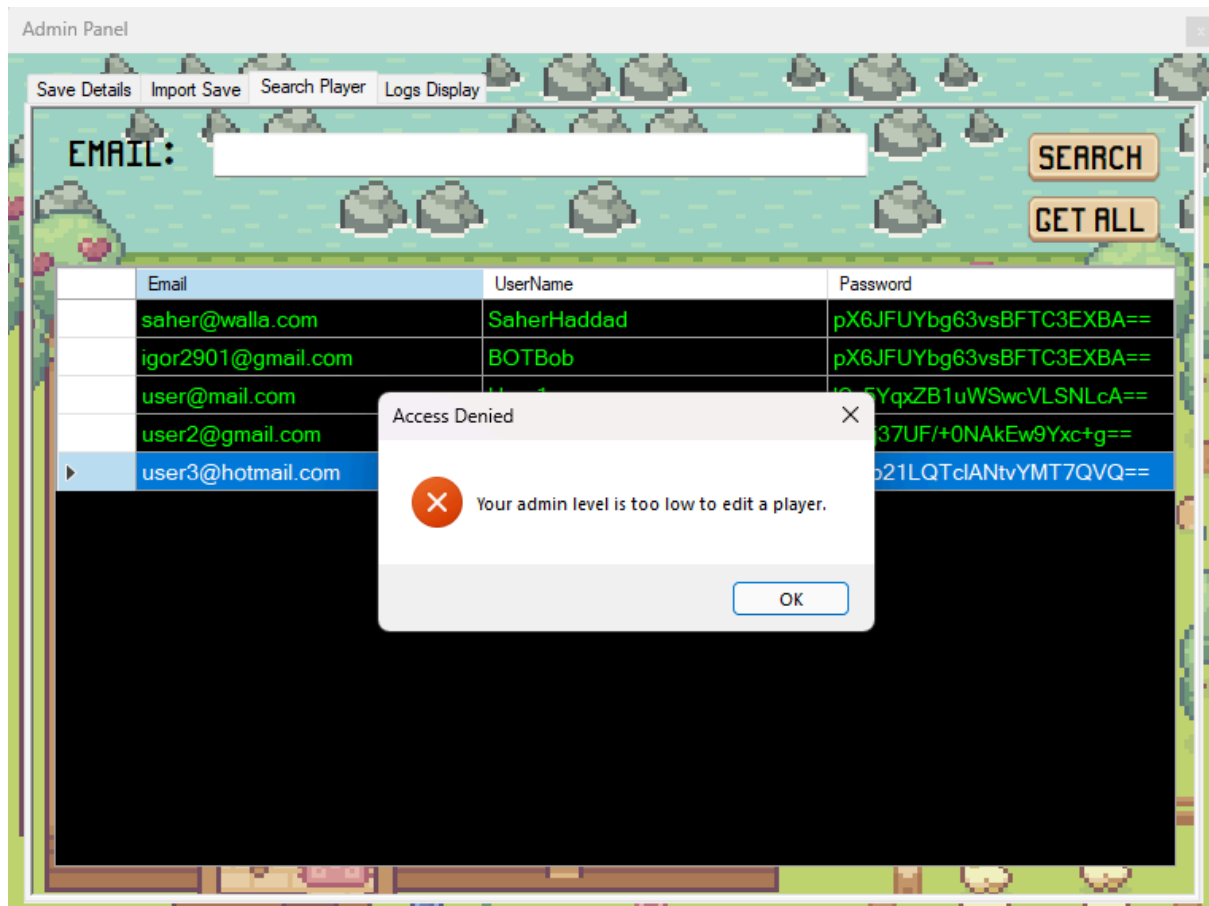

a. Search Player Tab

Admins have the ability to display all current players present in the cloud database by clicking “**Get All**” or search a player by their email and clicking “**Search**”.

By double clicking the desired player in the data grid view, only a player with Developer level has access to the [PlayerEditForm Panel](#), if a player with admin level tries to access this panel, he will be displayed a message that says “Your admin level is too low to edit a player” in a message box.

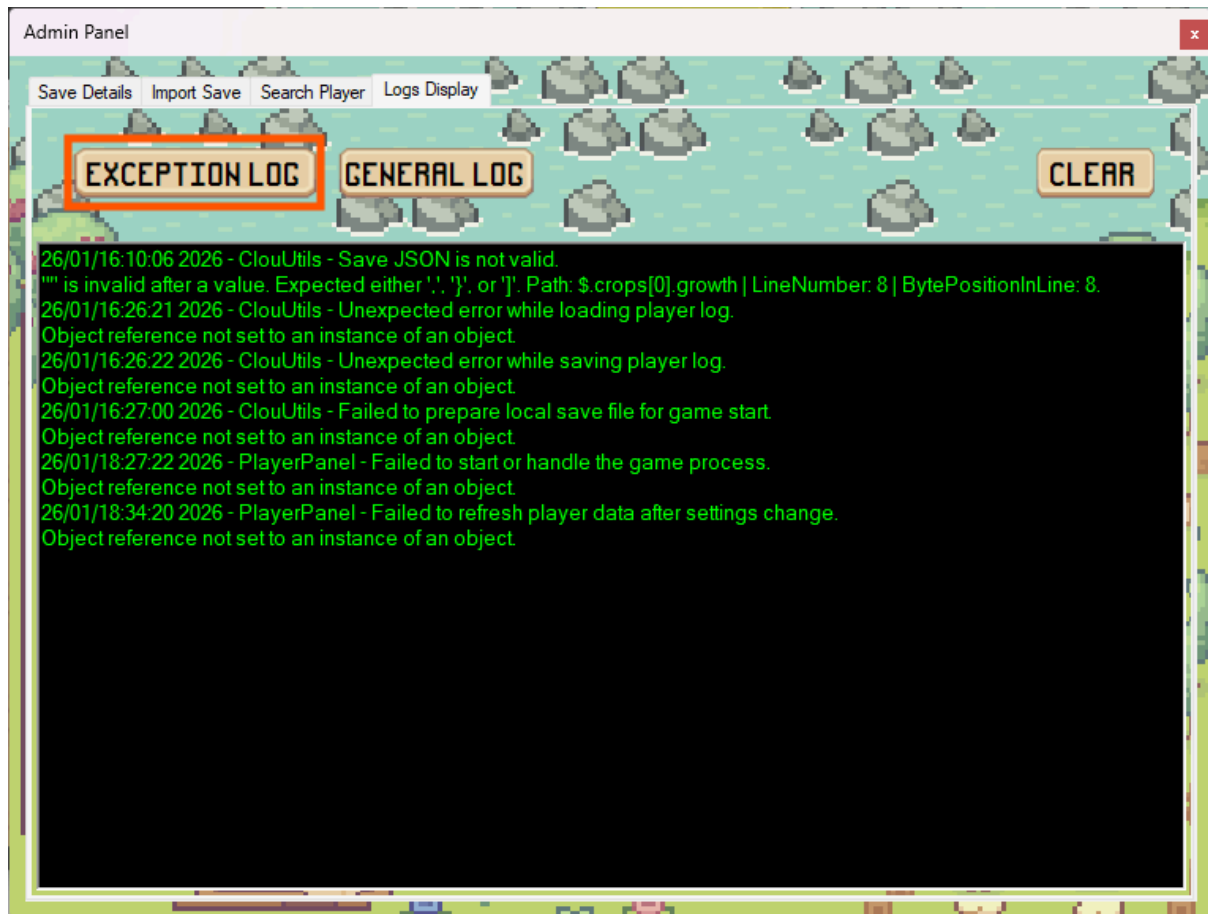

b. Logs Display Tab

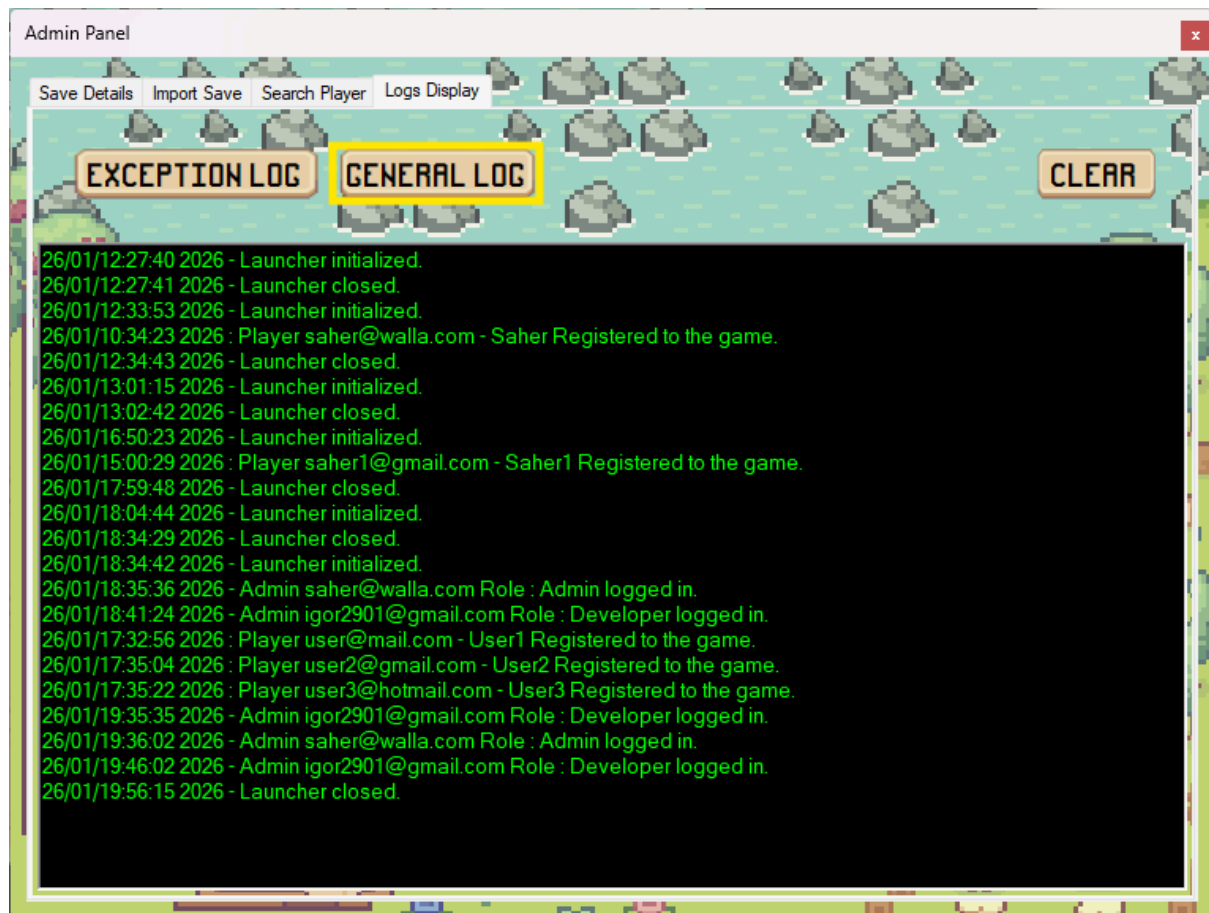

In this tab, Admins and Developers can monitor Exception logs to manage and get feedback on the launcher's performance and help find issues with detailed explanation to problems that can occur when the launcher is active.

General Logs are for the launcher activity, Admin/Developer login timestamps and player registration and messages.

Exception Logs are shown upon clicking “Exception Log”

General Logs are shown upon clicking “General Log”

c. PlayerEditForm Panel

One of the more important panels in the launcher, can only be accessed by players with Developer level privileges, the PlayerEditForm Panel. It offers Developers the option to change anything for a selected player from the [Search Player Tab](#), it allows changing player info and save game file data with verification checks for **Email** and **save game json file structure and its contents, ensuring that required fields (such as an inventory dictionary) are present and correctly formatted**. If one of those verifications fails, the **"Save"** button is disabled.

The screenshot shows the 'PlayerEditForm' window with a pixelated background. It contains several input fields and buttons:

- EMAIL:** A text input field containing 'user@mail.com'.
- USER NAME:** A text input field containing 'User1'.
- NEW PASSWORD:** A text input field containing 'Enter New Password'.
- PLAYER SAVE DETAILS (JSON):** A large text area displaying a JSON object. A yellow 'VERIFIED' label is positioned at the top right of this area.
- SAVE** and **CANCEL** buttons are located to the right of the JSON text area.

```
{
  "crops": null,
  "inventory": {
    "corn": 0,
    "egg": 0,
    "log": 0,
    "milk": 0,
    "stone": 0,
    "tomato": 0
  },
  "player": null,
  "tilled_soil": null,
  "time": {
    "day": 1,
    "minute": 360,
    "time_acc": 0,
    "total_minutes": 0
  }
}
```

When updating the email field, it checks the email is written in the right format and its not associated with another player, if one of those checks fails, the checkmark will turn to a **Red x**, if the check is passes, it will be a green tick.

Upon editing the save game file data in the rich textbox, there is a **verification** check for the json structure in the rich textbox's content upon change, if the structure fails the **verification**, it will disable the **"Save"** button. For example: the dictionary "balbla" is not a valid content within the json file, it should be "crops".

The screenshot shows a window titled "PlayerEditForm" with a pixel art background. It contains several input fields: "EMAIL:" with "user3@hotmail.com", "USER NAME:" with "User2", and "NEW PASSWORD:" with "Enter New Password". Below these is a section for "PLAYER SAVE DETAILS (JSON):" with a "SAVE" button and a "CANCEL" button. A red box highlights the "SAVE" button, and a yellow box highlights a "NOT VERIFIED" status. The JSON content in the editor is as follows:

```
{
  "blabla" null,
  "inventory": {
    "corn": 0,
    "egg": 0,
    "log": 0,
    "milk": 0,
    "stone": 0,
    "tomato": 0
  },
  "player": null,
  "tilled_soil": null,
  "time": {
    "day": 1,
    "minute": 360,
    "time_acc": 0,
    "total_minutes": 0
  }
}
```

Closing Statement

Now that we have finished going over the process of setting up the Azure Cosmos DB Emulator with the required database and containers, installed the CloudFarm Game Launcher and went over all the functionalities that the launcher offers, you can start to use it while having a full understanding of the program structure.

For any inquiries about the program, feel free to contact us here:
